

LiftLog (Workout Tracker App) – Review 1

HCI 584 – Nathan Hines – [Github Repo](#)

General Overview

LiftLog is a personal strength-training tracker application. The user records each workout (which exercises they did, and for every set the reps and the weight used) and the app keeps that history in a simple file on their computer. So far I have built the functions needed for adding a workout to data frame and then appending the new workout to the csv file that is the database.

Milestones

- Data visualization in notebook
- Front End Adding new workout
- Frontend View workout data

Reflection

- Much harder then I expected. But it has given me an appreciation for development process and how it is building upon concepts and bits as you work towards the end functionality.
